

Renewable Energy

at Cardinal View Senior Living

Solar energy is expected to power over 20% of the electricity used by Cardinal View Senior Living. The solar array covering most of the roof kicked off in April.

Solar energy is economical for buildings like Cardinal View which use large amounts of electric equipment and are continuously occupied day and night. The investment in solar energy has a payback of about five years.

Benefits include:

- Production of over 176,000 kWh of electricity, enough to offset the electrical usage of 15 average homes
- Reduction in greenhouse gas emissions equal to approximately 100,000 miles not driven

In addition, Cardinal View will utilize energy efficient lighting and have electric car charging stations in multiple locations.
